

Access PoD JSON Artifact Pack

Instructions for Registry, Verification, and Telemetry-Derived Artifacts

Status: Public Review Draft (Standards Exploration) | Document ID: APOD-TR-002 | Issued: 2025-12-27T00:00:00Z

1. Scope

This document specifies how to publish, validate, and use the JSON artifacts that support the Access PoD trust framework: CSC certificates, metric catalogs, sector profiles, and example artifacts. These files are intended for standards exploration, research review, and implementation study.

2. Files included

Filename	Purpose
csc-certificate.schema_v1a.json	Schema for CSC certificates (registry and verification).
csc_metric_catalog_schema_v1a.json	Schema for validating CSC Metric Catalog files.
csc_metric_catalog_v1a.json	Metric catalog (v1): metric IDs, factor mapping, normalization, thresholds, event fields.
csc_sector_profiles_v1a.json	Sector weighting profiles and gates (healthcare, finance, public sector).
example_csc_certificate_v1a.json	Example CSC certificate instance (integration testing only).
manifest_v1a.json	Pack manifest with SHA-256 checksums for all artifacts (recommended).

3. Versioning and stability

- Use semantic versioning for schemas and catalogs (e.g., 1.0.0).
- Never change the meaning of an existing metric_id; deprecate and introduce a new metric_id if needed.
- Publish new versions as new files (e.g., csc_metric_catalog_v2.json).
- Keep profile_id stable; introduce new profile IDs for breaking changes.
- Certificates must reference the profile_id used for scoring and the schema version.

4. Verification workflow (summary)

- 1 Fetch CSC certificate JSON from the registry (or local test bundle).
- 2 Confirm status and validity context (issued_at/expires_at).
- 3 Canonicalize JSON payload (JCS / RFC8785) before hashing.
- 4 Verify signed_payload_digest matches the canonicalized payload digest.
- 5 Verify signature using the issuer public key referenced by signature.kid.
- 6 Optionally verify evidence bundle item digests for integrity.
